## **CDE DAIRY MARK** NAGEMENT UPDATE All prices - APRIL 13, 2021 - except where noted

Class IV Rebounding: The pandemic has been difficult on Class IV milk and product prices during the last year. However, several factors have been working together recently to help facilitate a rebound in Class IV milk and product prices. March Class IV price was announced last week as \$14.18 per cwt. This certainly is not where we would like to see Class IV, but it is the highest announced Class IV price since March 2020's \$14.87. Although market uncertainty is holding back trading volume after August 2021, current Class IV milk futures continue to improve through the rest of the spring and summer.

There are a few factors that are working together to help improve Class IV milk price. Food service establishments use a lot of butter, which is a Class IV product. Recent food service sales data show that full-service restaurant sales are the best since the pandemic started but are still 18% below 2019. Regardless, the recent recovery in butter price is attributed to the resurgence in restaurant sales. In addition to increased food service sales, February butter exports (the most recent export data available) were the highest since August 2014 mainly because of increased new exports to the Middle East.

Milk powders, not including whey powders, are also Class IV dairy products, and these product values are increasing with unexpected export sales. Whey powder product prices are also increasing but are a byproduct of cheese manufacturing and are Class III dairy products. Nonfat dry milk and skim milk powder make up the bulk of total powder exports. According to the U.S. Dairy Export Council (USDEC), February powder exports were up 31% or 17,120 metric tons compared to February 2019, mainly because of increased sales to Southeast Asia and Mexico (+38% and +30%, respectively). Although U.S. powder prices are increasing, they are still a bargain compared to other major powder exporters. While domestic powder demand still lags pre-pandemic usage, increased exports, along with increased domestic butter usage and exports, are helping to bolster the Class IV price.

The net effect of the above factors has helped to increase the Class IV futures price in recent weeks. The current Class IV price for 2021 using actual Class IV prices for January through March and futures prices at market closing April 12 for the rest of the year averages \$16.19 per cwt. Last year, Class IV averaged \$13.49, and the five-year average

is \$14.61. May through December Class IV prices are far from being announced, but if current market conditions continue or improve, Class IV is looking much better than last year and the beginning of this year.

The current round of the Farmers to Families Food Box program is set to expire at the end of April. Although not official, the Biden administration is expected to extend the current program with perhaps revisions the Administration proposes will improve upon the current program. One such revision supported by the International Dairy Foods Association and National Milk Producers Federation, if approved, would make butter a mandatory dairy product for the food boxes rather than an optional item. Currently, one gallon of fluid milk plus five to six pounds of dairy products are required per food box. Cheese has been the predominant dairy product other than fluid milk to meet the current requirements. Increased governmental purchasing of cheese has been a large reason for the price disparity between Class III and Class IV. Making butter a required item will help to bolster Class IV milk price and theoretically shrink the gap between Class III and Class IV prices, thus reducing the negative impact on Producer Price
