

Site Survey

Situation Overview:

- A. *How did the team analyze potential sites for construction?* We consulted with Transformation Team members, along with the building contractors and other experienced individuals to weigh the pros and cons of each construction site option.
- B. *What variables did the team consider as they reviewed sites?* The major variable was avoiding the property line between the two preserved farms. In addition, the new barn needed 100 – 150 foot setback from the existing structures. The barn design also impacted the site survey.

Actions

- C. *How long, from start to finish, was the site survey process?* 3-4 months
- D. *Approximately, how much did the site survey work cost?* Not including permits, engineering fees were approximately \$12,000+ from start, through meetings, and final inspection by the engineering firm.

Results

- E. [See the resources section of this case study for the project blueprint.](#)
